

Ensuring employees have access to advanced primary care is the best way to improve health care quality, patient experience and reduce costs

U.S. adults who regularly see a primary care physician have 33% lower health care costs and 19% lower odds of dying prematurely than those who see only a specialist.

The U.S. could save \$67 billion each year if everyone used a primary care provider as their principal source of care.

Every \$1 increase in primary care spending produces \$13 in savings.

Primary care is fragmented and underutilized

- **Misaligned financial incentives**, inadequate infrastructure and a lack of information-sharing compromise quality and increase costs.
- Just **4-7% of health care dollars** go toward primary care.
- **Primary care accounts for 35% of all health care visits** yet influences 90% of total health care spending.

A Network Built to Reflect Purchaser Priorities

PBGH is developing a turnkey national primary care network with quality-based specialty referrals to promote advanced primary care. Our solution is designed to improve health, well-being, prevention and early intervention to improve health and reduce the total cost of care.
